FHA Risk Monitor — Projections Validation Report

Snapshot period: May 2026 (2026-05) **Performance-period end:** 2026-05-31 **Report generated:** 2026-07-01T17:50:45Z **Prepared for:** Stefanie Allman, Compliance **Requester:** Michael Kunisaki (mkunisaki@afncorp.com) **Source:** scripts/build_projections.py v1.0

This report validates the loan-level → office → HOC → national projections shipped in the projections block of the monthly snapshot JSON. It is intended to be auditable end-to-end: every office-level number can be traced to the underlying loan set and reproduced by hand using the recipe in the Methodology appendix.

Executive Summary

- **Total offices evaluated:** 79
- **Current threshold cohort:** 42 safe / 19 watch / 18 breach
- **Projected 3mo (base) cohort:** 69 safe / 5 watch / 5 breach
- **Projected 3mo (worst) cohort:** 5 safe / 3 watch / 71 breach
- **National 3mo base:** 4.868% dq rate on 8,710 loans (dropoffs: 776)

Top 5 offices in projected watch/breach at 3-month base scenario

# Office	HOC	Loans	Current CR	Projected 3mo CR (base)	Projected Status
1 Charleston	Philadelphia	17	388	273.9	BREACH
2 Lubbock	Denver	27	588	267.9	BREACH
3 Shreveport	Denver	30	246	228.2	BREACH
4 Oklahoma City	Denver	19	400	228.2	BREACH
5 Atlanta	Atlanta	505	213	203.2	BREACH

Threshold crossings — offices that escalate under any horizon/scenario

166 crossing events total (across 1/3/6mo × best/base/worst). Highest-priority (safe→breach) shown first, capped at 15 rows.

Office	HOC	Loans	Horizon	Scenario	Current CR	Projected CR	Transition
Wilmington	—	20	6mo	worst	127	382.5	SAFE → BREACH
Detroit	Philadelphia	414	6mo	worst	99	356.9	SAFE → BREACH
Springfield	Denver	16	1mo	worst	136	352.9	SAFE → BREACH
Jackson	Atlanta	35	6mo	worst	149	346.1	SAFE → BREACH
Spokane	Santa Ana	10	6mo	worst	0	346.1	SAFE → BREACH
Sacramento	Santa Ana	105	6mo	worst	126	335.0	SAFE → BREACH
Jacksonville	Atlanta	364	6mo	worst	125	326.3	SAFE → BREACH
Cincinnati	Philadelphia	53	6mo	worst	103	323.0	SAFE → BREACH
Memphis	Atlanta	39	6mo	worst	64	323.0	SAFE → BREACH
Grand Rapids	Philadelphia	77	6mo	worst	127	320.6	SAFE → BREACH
New York	Philadelphia	136	6mo	worst	131	318.8	SAFE → BREACH
Orlando	Atlanta	217	6mo	worst	146	308.6	SAFE → BREACH
Washington	—	180	6mo	worst	58	308.6	SAFE → BREACH
Wilmington	—	20	3mo	worst	127	308.1	SAFE → BREACH
Nashville	Atlanta	108	6mo	worst	115	306.6	SAFE → BREACH

Per-Office Projected Compare Ratios

Every HUD office in the current window, sorted by projected 3mo/base CR (highest first). Columns:

- **Cur** — Compare Ratio as of the snapshot's performance period.
- **1mo / 3mo / 6mo** — projected Compare Ratio at that horizon. Each cell shows best / base / worst.

- **N** — loan count in the current 24-month window.
- **Drop 3mo** — loans projected to fall off the office denominator by month 3.
- **Status** — current → projected 3mo/base threshold status.

Office	HOC	N	Cur	1mo (best/ base/ worst)	3mo (best/ base/ worst)	6mo (best/ base/ worst)	Drop 3mo	Status

Methodology Appendix

Every number in this report is computed at the individual loan level, then aggregated up to office, HOC, and national roll-ups. There are no office-level estimates that a hand-check against Encompass could not reproduce.

1. HUD 24-month window

HUD reports each month with a rolling 24-month window of “beginning amortization dates” (first-payment dates) ending at `performance_period = 2026-05-31`.

For a projection **H** months forward, the new window-start is:

`cutoff_H = (performance_period + 1 day) - (24 - H) months`

A loan is projected to fall off the denominator at horizon **H** iff its `first_payment_date` is strictly less than `cutoff_H`. Loans without a parseable `first_payment_date` are assumed to remain in-window — this matches the current UI (`rollforwardWindowStart` in `src/lib/`

computeData.ts) and is deliberately conservative: missing data never shrinks a denominator.

2. Scenarios — ±10% office-side delinquency lever

The stress factor is **10%** (Michael Kunisaki’s decision, task-spec §Michael’s Decisions #3). It is an **office-side stress**: national delinquency rate stays at the base-scenario projection at each horizon and serves as the fixed reference denominator for the Compare Ratio.

Scenario	Office numerator	Denominator	Semantics
base	Loans in-window that are currently delinquent	Loans still in-window at horizon	No delinquency change; only window rolls forward.
worst	base numerator + round($0.10 \times$ in-window non-DQ)	Same as base	+10% of the office’s still-in-window, currently-non-DQ loans become DQ.
best	base numerator – round($0.10 \times$ in-window DQ), floored at 0	Same as base	–10% of the office’s currently-DQ, still-in-window loans cure.

National reference policy: national delinquency rate is fixed at the BASE-scenario projection for each horizon across all three scenarios (best/base/worst). The ±10% lever is applied office-side only, so ‘worst’ reflects a genuine worst-case for that office against a stable peer.

3. Compare Ratio formula

$$\begin{aligned} \text{office_projected_delinquency_rate} &= \text{office_num_at_horizon} / \text{office_den_at_horizon} \\ \text{national_projected_delinquency_rate} &= \text{national_base_num_at_horizon} / \text{national_base_den_at_horizon} \\ \text{projected_compare_ratio} &= (\text{office_dq_rate} / \text{national_dq_rate}) * 100 \end{aligned}$$

Numerator and denominator both use the same rolled-forward loan population — no mismatched windows. Ratios are rounded to one decimal place at the report boundary; internal math stays in double precision.

4. Threshold classification

- safe → $CR < 150$
- watch → $150 \leq CR < 200$
- breach → $CR \geq 200$

A **threshold crossing** is any transition where the current status is strictly less severe than the projected status under some horizon/scenario. Specifically: safe→watch, safe→breach, or watch→breach. Watch→watch or breach→breach at a lower projected CR are still worth noting but are reported in the Per-Office table rather than the crossings summary.

5. Reproducibility recipe (hand-checkable, one office)

For any office in the Per-Office table, follow these steps against the Encompass source data used by build-snapshot.py:

1. Filter loans to that HUD office.
2. Split into (a) still-in-window at horizon H (first_payment_date ≥ cutoff_H) and (b) dropping off.
3. Under **base**: numerator = count of still-in-window loans where is_delinquent = true; denominator = |(a)|.
4. Under **worst**: numerator = base numerator + round(0.10 × |non-DQ in (a)|); denominator unchanged.
5. Under **best**: numerator = base numerator – round(0.10 × |DQ in (a)|), floored at 0.
6. Compare Ratio = office_dq_rate / national_base_dq_rate × 100 (national values in the report tables).

Sample Loan-Level Detail — Top Flagged Offices

Every loan underlying the highest-projected offices, so a Compliance review can spot-check against Encompass. Loans are grouped by office and sorted by months_until_falls_off (ascending — loans closest to dropping off the window first).

Charleston (HOC Philadelphia)

- Current loans in window: **17** — currently delinquent: 2
- Current Compare Ratio: **388** → 3mo/base: **273.9**
- Projected drop-offs by 3mo: **2** (15 still in window)
